

SOFE 4790U: Distributed Systems (Fall 2021) Instructor: Dr. Q. Mahmoud/H. Singh

Individual Programming Assignment #1 [Monday, Oct 11 -- Wednesday, Oct. 20]

The objective of this individual programming assignment is to get a flavour of the effort involved in designing and developing client/server applications. You will practice designing and developing an innovative client-server application of your choice using Java sockets (I recommend using TCP sockets, but you may use UDP datagrams if you wish).

The Task

Design and develop a novel, usable, and useful client/server application of your choice. It must accomplish something useful and has some novel/interesting features. The server must provide at least 2 significant functionalities or services for clients to use, and the application must have 2 novel/interesting features.

E.g. of Services: locates the supplied list of key words in a given text file (don't use this exact idea for your implementation!) but you can think of any other word editing services or image/audio/video processing, mathematical services.

E.g. of Novel/Interesting Feature: Server responds with an approximate duration guarantee to complete the given request within. (don't use this exact idea for your implementation!) but you can think of any other similar server feature.

Guidelines

- Your application must consist of a multi-threaded server and a client, both coded in Java, and it cannot be an HTTP proxy server.
- You must use the Java programming language.
- You must use sockets; applications that make use of high-level APIs (such as URL, URConnection, etc) will not be accepted.
- Your application should continue to handle clients' requests until it is manually terminated, or you have a UI for run/shutdown.

Important Notes

- **Deadline**: Assignment#1 <u>must be demo-ed during the assigned TA office Hours for Assignment#1</u> and submitted **by 11:59pm (night) on Wednesday, October 18**. *No extensions, so plan accordingly*.
- Your solution must be designed and developed by yourself (your own work).
- While students are encouraged to discuss the assignment and general ideas for solutions, each student must design and develop his/her own solution and code. No code sharing is allowed, and no two or more students can have the same application. **JPlag will be used for detecting code similarity**.
- The assignment will be assessed based on the grading rubrics provided on page 2 of this document.

Submission Guidelines (note the 2-step submission)

- 1) Source & class files, and a README file: Submit your assignment solution source code (*.java) and bytecode (*.class) files, along with a README file on Github by 11:59pm (night) on Wednesday, Oct 20 as per the following instructions:
 - a. Create a Github account (https://github.com/join)
 - b. Register for Github Devpack in order to get private repositories (https://education.github.com/pack)
 - c. Go to the following link for Assignment1: https://classroom.github.com/a/X-3UoZBz
 - d. If you have not used Github before, go through this one-hour tutorial: https://lab.github.com/githubtraining/introduction-to-github
 - e. If you would like to use in-browser IDE (not needed), Repl.it (http://repl.it) has been enabled.
 - f. Your submission must include a README file with a brief description (one paragraph) of the application, and instructions on how to run your application.
 - g. If your applications require any resource files, make sure you include them in your submission on Github.
- 2) **Report**: Submit your assignment report through Canvas by **11:59pm** (**night**) **on Monday, Oct 18** (look under Home -> Assignments -> Assignment #1 Submission). Your report must be in PDF or Word and must include:
 - a. One full-page (approx. 500 words) detailing your application idea, novel feature(s), challenges and solutions. You may include one clear diagram but no screenshots of the application.
 - b. A description of the tests you have run to demonstrate the functionality of your application. You must describe the actions with screenshots, and clearly demonstrate this was done by you on your own laptop (e.g. show command-line prompt with your account name).

Grading Rubrics

Item	Excellent	Good	Satisfactory	Unsatisfactory	Zero (zero)
(%)	(full mark)	(75%)	(50%)	(25%)	
Report	Clearly	Readable	Documentation	Documentation	Non-existent.
(20)	documented and	but not well	is minimal, but	is minimal,	
	well organized	organized or	clear sample	with no sample	
	with novel	missing	run.	run.	
	features, sample	parts.			
	runs with				
	description &				
	screen shots,				
	challenges and				
	solutions.				
Usefulness	Useful and	Nothing	Requires a	Not useful or	Non-existent.
and usability	intuitive to use.	special.	manual to use.	usable.	
(20)
